

HONEYWELL **DYNAMIC PRICING** **HACKATHON**

PRESENTER'S NAME
PRESENTER'S TITLE

November 20, 2025

Honeywell

AGENDA

- Introduction to the complexities of HON catalog pricing
- Hackathon introduction

INTRODUCTION TO HON CATALOG PRICING CHALLENGE

Customer | Channel

- Commercial Airline Operators
- Business & General Aviation (BGA)
- Authorized Channel Partners
- Maintenance & Repair Operations (MRO)
- Defense & Space - International
- Defense & Space - US Gov

Offerings

- Aftermarket Spare parts
 - Avionics, Navigation, Sensors
 - Engines, Power systems
 - Engine & Motion control, Air & Thermal
- Spares Exchange (SPEX)
- Repair & Overhaul (R&O)
 - Repair
 - Overhaul
 - Test
 - Scrap
- Used Serviceable Market (USM)

Catalog Pricing Model

List Price (\$) – Standard Discount (%)

- New Spares – Unconstrained
- New Spares – Constrained
- R&O Universal Flat Rate (UFR)
- R&O Spares Exchange (SPEX)
- R&O US Gov UFR – FAR compliant

Dynamic Catalog - Price Optimization Challenge

1. How do we ensure Catalog Prices are aligned to Market (considering external and internal factors like New Spare vs. USM)?
2. How do we ensure Catalog Price hierarchy/integrity is maintained (New Spare > UFR > Contracted Repair)?
3. How do we know we have truly optimized our prices to drive profitable growth?

Objective of hackathon is to create innovative solutions that will address HON dynamic pricing needs

PROBLEM STATEMENT

- **Situation: Revenue is down at your ride share company. The CEO has challenged the IT team to develop a dynamic pricing solution to maximize profits. Your competitors have the same type of data as your company which does not give you a competitive advantage. You are challenged to adopt new agenticAI technology to provide a competitive advantage in your dynamic pricing solution**
- **This situation has similarities to catalog demand pricing at HON with supply/demand, customer tier, and service level attributes**

DATA

Data Element	HON dynamic pricing similarity
# of riders	Demand for HON catalog item
# of drivers	HON supply (Aero is a supply constraint industry)
Location category	Geographic regions
Customer Loyalty Status	HON has different tiers of customers based on the business volume
Number of past rides	Customer buying history
Average ratings	
Time of booking	
Expected ride duration	Base value of HON catalog item
Vehicle type	Quality of HON item (new, overhaul, repair) and pricing constraints
Historical cost of ride	Previous HON catalog prices

Be creative on how data related to Honeywell – think of additional data you can bring in

JUDGING CRITERIA

- **Creativity – 40%**
 - How novel was your agent's reasoning, and how well did it synthesize data points?
 - Did you find and integrate unique live data sources that provided real business value?
 - What innovative methods did you demonstrate that are relevant to HON?
- **Explainability – 30%**
 - How clearly is the "why" behind a price surge explained to the end-user?
 - How well did the team articulate their architecture and the agent's decision-making process during the demo?
- **Technical implementation – 20%**
 - Was the full, required tech stack (Next.js, FastAPI, LangChain, n8n/MCP) successfully integrated & function smoothly?
- **Visualization – 10%**
 - Does the user interface make it easy to understand the pricing and the reasoning at-a-glance?

HACKATHON LOGISTICS AND OTHER INFO

- Time bound – Presentations on 5th
- Team can add to the dataset to demonstrate agenticAI creativity
- Teams will be assigned by Charles
- Teams must use Next.js, FastAPI, LangChain, and n8n or MCP
- Teams must submit documentation, diagrams & a 10-min video recording of your work
- Presentation format
 - Total time for presentation – 15 minutes (10 minutes presentation 5 minutes for questions)
 - Presentation includes demo of UX
 - Slides need to include:
 - AI generated pricing strategy and goodness measure
 - Architecture diagram
 - Recommendations on how the solution can be applied to HON dynamic pricing
